

NEXT_CHAT 2026-09-28 - matts-timer-app

Cold start for the next Fable session in this repo. Closed on Matt's words: "wrap this session up and push".

Where it stands

- Build on the phone (RFGL4275NVH): 68019db, installed 2026-09-28 06:54:07 on his word [measured, n=1]. `dist/MattsTimer.apk` is still the pre-v2 build; it was not replaced.
- Alarm phone checks 1-7: all PASS [measured, n=1 each; STOP from the card n=2]. Record: `docs/DECISIONS_LOG.md`, the three entries dated 2026-09-28.
- His words on the finding: "it rang fine the stop button should be on the screen when the alarm is firing". Built at 68019db (MainActivity opens AlarmActivity while a ring is live), signed, and the app-in-front ring passed [measured, n=1].
- Pushed to origin/main at the commit that adds this file.

Open, all waiting on his word

- 1 Ringing after the app is swiped from recents (dead process) [verify, n=0]. `am kill` did not end the process; it needs his thumb.
- 2 On 68019db [verify, n=0]: the alarm editor or the wheel picker open when it rings; STOP from the card while the ringing screen is up; leaving the ringing screen and coming back; split-screen (Opus's follow-up, not fixed, not asked for).
- 3 Asked twice, not answered: the alarm firing while he is in another app, unlocked. Android shows a pill, STOP is in the shade. The only lever is his Samsung pop-up style setting; own prompt first (global Section 12 item 17).
- 4 On hold: his ears on the four wake voices, restart without unlock, time zone change. The 15-minute cut is dropped, his words: "Don't worry about the 15 minute test".
- 5 A spent 2:38 PM one-shot is left in the alarm list (the phone was locked). Nothing is armed. Delete it on his word.
- 6 `dist/MattsTimer.apk`: replacing it with the 68019db build is its own commit naming the source hash, on his word.

Phone rules learned this session

- `uiautomator dump` fails while the timer is counting ("could not get idle state"). Read the screen before starting a timer, or use a screenshot.
- The notification shade closes by itself. A shade tap goes to a node read from the screen immediately before the tap, never to a coordinate from an older screenshot. Fable's miss on ring 1 is in the log.
- Keeping an alarm quiet without touching a setting: stop it inside the ramp. 10 s in is gain 0.16 [measured, n=1].
- Other sessions use the phone. Before any adb: ListAgents, a notice to the busy ones, "timer off" after.

Cost note (n=1 session, 9 meter reads)

Session effort medium throughout; no high or xhigh item ran. One Opus sub-agent run, about 93k tokens.

"Weekly - Fable" by get_usage: 69 percent at the start (06:17 CDT), 71 percent after the morning's work (06:59), 83 percent at 14:33 when the session resumed, 83 percent at the last read (14:40). This session was idle from 07:05 to 14:33, so the 12 points in that gap belong to other sessions; this session's share is at most the 2 points of the morning plus under 1 point in the afternoon, and other sessions were live during both, so that is an upper bound. "Weekly - all models": 66, 67, 79, 80 percent at the same reads. The meter resets 2026-09-28 22:00 UTC.
