

# NEXT\_CHAT 2026-09-20 - matts-timer-app

Cold start for the next Fable session in this repo.

## Where it stands

- Repo flipped to Fable-main on 2026-09-20 (CLAUDE.md Section 1, his words quoted there). This session wrote the rule files only. No app code changed; the app is as commit 4cbb214 left it ("Add RESET button and selectable sound voices").
- The opus agent type loads at session start, so it is first usable in the next session, not the one that wrote it.
- Nothing was installed on the phone and no adb command was sent to a device. `adb devices` listed none [measured, n=1].
- Not pushed.

## First things in the next session

- 1 Read the "Weekly - Fable" meter with `get_usage` (start number for the cost note).
- 2 `docs/handoff/FOR_FABLE.md` item 1: ask Matt to accept or edit the Fable-owned list.
- 3 Take his feature adds, in his words, into `FOR_FABLE.md` item 2, then spec and spawn Opus per CLAUDE.md Section 2.
- 4 `FOR_FABLE.md` item 4 (finish cue with the screen off or the app in the background, untested) is a question for him, not a build.

## Also live

ListAgents on 2026-09-20 showed a second desktop session named "Gym timer app with presets [3a5138]", idle, started minutes before this one. Its working directory was not checked [verify]. One writer at a time: before any Opus spawn, confirm `git status` is clean and that session is not writing here.

## Cost note (n=1 session)

"Weekly - Fable" by `get_usage`: 80 percent at the first read (taken partway into the session, after the repo reads), 80 percent at the last read before this file was written. Difference: under 1 point at the meter's resolution. Four other desktop sessions were live at the time, so even that is an upper bound. "Weekly - all models" read 81 percent both times.
